naturally fractured reservoirs constitute a substantial percentage of remaining hydrocarbon resources they create exploration targets in otherwise impermeable rocks including under explored crystalline basement and they can be used as geological stores for anthropogenic carbon dioxide their complex behaviour during production has traditionally proved difficult to predict causing a large degree of uncertainty in reservoir development the applied study of naturally fractured reservoirs seeks to constrain this uncertainty by developing new understanding and is necessarily a broad integrated interdisciplinary topic this

book addresses some of the challenges and advances in knowledge approaches concepts and methods used to characterize the interplay of rock matrix and fracture networks relevant to fluid flow and hydrocarbon recovery topics include describing characterizing and identifying controls on fracture networks from outcrops cores geophysical data digital and numerical models geomechanical influences on reservoir behaviour numerical modelling and simulation of fluid flow and case studies of the exploration and development of carbonate siliciclastic and metamorphic naturally fractured reservoirs

in the past conservative or nonoperative treatment of fractures of the hand has been the rule and severe and multiple fractures usually did not receive surgical attention there are probably several reasons why this is so rarely did these fractures threaten life they usually healed rapidly and after immobilization hand pain usually subsided at the same time intraarticular fractures frequently were unstable and often displaced and attempts to correct deformity were considered difficult to achieve as a result the ultimate joint motion in many cases was limited it can fairly be said that decisions and techniques regarding internal fixation of small joints and bones were not known to most surgeons although the history of internal fixation is not extensive there have been some exciting events in the 16th century gold plates were used to repair cleft palates later the chinese employed wire loop sutures to correct difficult fractures in the 18th century silver cerclage wires were used to achieve fixation and promote early bone healing although these fracture treatments occasionally proved successful more frequently they did not and they never enjoyed wide acceptance doctors alan free land michael jabaley and james hughes have described this history of bone fixation in a manner that is both colorful and educational and they have managed to extract the essential features that lend continuity to the story of the development of internal fixation
